MEAN-FIELD THEORY

The mean-field Nambu-Gor'kov Hamiltonian is

$$H = \frac{1}{2} \iint d^3\mathbf{r}\, d^3\mathbf{r}'\, \widehat{\Psi}^\dagger(\mathbf{r}') \begin{pmatrix} \xi(\mathbf{r})\delta(\mathbf{r}-\mathbf{r}')\hat{1} & \hat{\Delta}(\mathbf{r},\mathbf{r}') \\ \hat{\Delta}^\dagger(\mathbf{r},\mathbf{r}') & -\xi(\mathbf{r})\delta(\mathbf{r}-\mathbf{r}')\hat{1} \end{pmatrix} \widehat{\Psi}(\mathbf{r}) \tag{1}$$

$$\equiv \frac{1}{2} \iint d^3\mathbf{r}\, d^3\mathbf{r}'\, \widehat{\Psi}^\dagger(\mathbf{r}')\widehat{\tau}_3 \left(\xi(\mathbf{r})\delta(\mathbf{r}-\mathbf{r}') + \widehat{\Delta}(\mathbf{r},\mathbf{r}') \right) \widehat{\Psi}(\mathbf{r}). \tag{2}$$

where

$$\widehat{\Delta}(\mathbf{r},\mathbf{r}') = \begin{pmatrix} 0 & \hat{\Delta}(\mathbf{r},\mathbf{r}') \\ -\hat{\Delta}^\dagger(\mathbf{r},\mathbf{r}') & 0 \end{pmatrix} \tag{3}$$

When the system is homogeneous, the two-point gap function only depends on the relative coordinate, i.e., $\hat{\Delta}(\mathbf{r},\mathbf{r}') = \hat{\Delta}(\mathbf{r}-\mathbf{r}')$. In this case, we can transform to momentum space, and the Hamiltonian becomes

$$H = \frac{1}{2} \sum_{\mathbf{p}} \widehat{\Psi}_{\mathbf{p}}^\dagger \widehat{\tau}_3 (\xi_{\mathbf{p}} + \widehat{\Delta}(\mathbf{p})) \widehat{\Psi}_{\mathbf{p}}. \tag{4}$$

where $\widehat{\Psi}_{\mathbf{p}}^\dagger = (c_{\mathbf{p}\uparrow}^\dagger, c_{\mathbf{p}\downarrow}^\dagger, c_{-\mathbf{p}\uparrow}, c_{-\mathbf{p}\downarrow})$.

FINITE TEMPERATURE

The imaginary time Green's function is

$$\widehat{G}(\mathbf{r}\tau, \mathbf{r}'\tau') = \widehat{G}(\mathbf{r}, \mathbf{r}'; \tau-\tau') = -\left\langle T_\tau \widehat{\Psi}(\mathbf{r},\tau)\widehat{\Psi}^\dagger(\mathbf{r}',\tau') \right\rangle \equiv \begin{pmatrix} \hat{G} & \hat{F} \\ \underline{\hat{F}} & \underline{\hat{G}} \end{pmatrix} \tag{5}$$

The unperturbed Matsubara Green's function is

$$\widehat{G}_0(\mathbf{p}, i\epsilon_n) = (i\epsilon_n - \widehat{\tau}_3\xi_{\mathbf{p}})^{-1} = -\frac{i\epsilon_n + \widehat{\tau}_3\xi_{\mathbf{p}}}{\epsilon_n^2 + \xi_{\mathbf{p}}^2}. \tag{6}$$

where $\xi_p = \frac{p^2}{2m^*} - \mu$, In bulk, the Gorkov Green's function satisfies

$$\widehat{G}^{-1}(\mathbf{p}, i\epsilon_n) = \widehat{G}_0^{-1}(\mathbf{p}, i\epsilon_n) - \widehat{\tau}_3\widehat{\Delta}(\mathbf{p}) = i\epsilon_n - \widehat{\tau}_3\xi_{\mathbf{p}} - \widehat{\tau}_3\widehat{\Delta}(\mathbf{p}). \tag{7}$$

which gives

$$\widehat{G}(\mathbf{p}, i\epsilon_n) = -\frac{i\epsilon_n + \widehat{\tau}_3\xi_{\mathbf{p}} + \widehat{\tau}_3\widehat{\Delta}(\mathbf{p})}{\epsilon_n^2 + \xi_{\mathbf{p}}^2 + |\Delta|^2} \tag{8}$$

1

The bulk quasiclassical Green's function is

$$\widehat{g}(\mathbf{p}, i\epsilon_n) = \int \mathrm{d}\xi_p \widehat{G}(\mathbf{p}, i\epsilon_n) \widehat{\tau}_3 = -\pi \frac{i\epsilon_n \widehat{\tau}_3 - \widehat{\Delta}(\mathbf{p})}{\sqrt{|\Delta|^2 + \epsilon_n^2}} = \frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}} \begin{pmatrix} -i\epsilon_n & \hat{\Delta} \\ -\hat{\Delta}^\dagger & i\epsilon_n \end{pmatrix} \equiv \begin{pmatrix} \hat{g} & \hat{f} \\ \underline{\hat{f}} & \underline{\hat{g}} \end{pmatrix}$$

(9)

and it satisfies the normalization condition

$$\widehat{g}(\mathbf{p}, i\epsilon_n)^2 = -\pi^2 \widehat{1}.$$

(10)

The bulk quasiclassical Green's function satisfies

$$\left[i\epsilon_n \widehat{\tau}_3 - \widehat{\Delta}, \widehat{g} \right] = 0$$

(11)

But when near the boundary or impurities, the quasiclassical Green's function $\widehat{g}(\mathbf{R}, \mathbf{p}; \epsilon)$ and the gap function $\widehat{\Delta}(\mathbf{R}, \mathbf{p})$ are inhomogeneous, and are described by the Eilenberger equation and gap equation.

$$\left[i\epsilon_n \widehat{\tau}_3 - \widehat{\Delta}(\mathbf{R}, \mathbf{p}), \widehat{g}(\mathbf{R}, \mathbf{p}; i\epsilon_n) \right] + i\hbar \mathbf{v}_p \cdot \nabla \widehat{g}(\mathbf{R}, \mathbf{p}; i\epsilon_n) = 0$$

(12)

and

$$\hat{\Delta}(\mathbf{R}, \mathbf{p}) = T \sum_{\epsilon_n = -\omega_c}^{\omega_c} \left\langle v(\mathbf{p}, \mathbf{p}') \hat{f}(\mathbf{R}, \mathbf{p}', \epsilon_n) \right\rangle_{p'}$$

(13)

Here $\mathbf{R} = \frac{1}{2}(\mathbf{r} + \mathbf{r}')$ is the center of the pair.

Reference Kita's book section 14.1 and Vorontsov 2003, from the definition of the Green's function, we have symmetry relations

$$\underline{\hat{f}}(\mathbf{p}, \mathbf{R}; \epsilon_n) = \hat{f}(-\mathbf{p}, \mathbf{R}; \epsilon_n)^* = -\hat{f}(\mathbf{p}, \mathbf{R}; -\epsilon_n)^\dagger$$

(14)

$$\underline{\hat{g}}(\mathbf{p}, \mathbf{R}; \epsilon_n) = \hat{g}(-\mathbf{p}, \mathbf{R}; \epsilon_n)^* = \hat{g}(-\mathbf{p}, \mathbf{R}; -\epsilon_n)^T$$

(15)

GAP EQUATION

Now we neglect the spin structure, i.e. discard the little hats. In bulk, we have

$$\Delta(\mathbf{p}) = T \sum_{\epsilon_n = -\omega_c}^{\omega_c} \left\langle v(\mathbf{p}, \mathbf{p}') \frac{\pi \Delta(\mathbf{p}')}{\sqrt{|\Delta|^2 + \epsilon_n^2}} \right\rangle_{p'}$$

(16)

Move everything to the right hand side and subtract Eq. (13) from it, we get

$$0 = T \sum_{\epsilon_n=-\infty}^{\infty} \left[\left\langle v(\mathbf{p}, \mathbf{p}') \frac{f(\mathbf{R}, \mathbf{p}', \epsilon_n)}{\Delta(\mathbf{R}, \mathbf{p})} \right\rangle_{p'} - \left\langle v(\mathbf{p}'', \mathbf{p}') \frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}} \frac{\Delta(\mathbf{p}')}{\Delta(\mathbf{p}'')} \right\rangle_{p'} \right] \tag{17}$$

which gives

$$\Delta(\mathbf{R}, \mathbf{p}) = \frac{T \sum_{\epsilon_n}^{\infty} \left\langle v(\mathbf{p}, \mathbf{p}') \hat{f}(\mathbf{R}, \mathbf{p}', \epsilon_n) \right\rangle_{p'}}{T \sum_{\epsilon_n}^{\infty} \left\langle v(\mathbf{p}'', \mathbf{p}') \frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}} \frac{\Delta(\mathbf{p}')}{\Delta(\mathbf{p}'')} \right\rangle_{p'}} \tag{18}$$

We have the Digamma function

$$K(T) = T \sum_{\epsilon_n=-\omega_c}^{\omega_c} \frac{\pi}{|\epsilon_n|} \approx \ln \left(1.13 \frac{\omega_c}{T} \right) \tag{19}$$

In bulk at T_c, we have

$$\Delta(\mathbf{p}) = K(T_c) \left\langle v(\mathbf{p}, \mathbf{p}') \Delta(\mathbf{p}') \right\rangle_{p'} \tag{20}$$

and we have

$$K(T_c) - K(T) = \ln(T/T_c) = \frac{\Delta(\mathbf{p}'')}{\left\langle v(\mathbf{p}'', \mathbf{p}') \Delta(\mathbf{p}') \right\rangle_{p'}} \bigg|_{T_c} - T \sum_{\epsilon_n=-\omega_c}^{\omega_c} \frac{\pi}{|\epsilon_n|} \tag{21}$$

Substitute in Eq. (13), we get another equation to determine the gap inhomogeneity:

$$\ln \frac{T}{T_c} = T \sum_{\epsilon_n=-\infty}^{\infty} \left[\frac{\left\langle v(\mathbf{p}, \mathbf{p}') f(\mathbf{R}, \mathbf{p}', \epsilon_n) \right\rangle_{p'} / \Delta(\mathbf{R}, \mathbf{p})}{\left\langle v(\mathbf{p}'', \mathbf{p}') \Delta(\mathbf{p}') \right\rangle_{p'} / \Delta(\mathbf{p}'') \big|_{T_c}} - \frac{\pi}{|\epsilon_n|} \right] \tag{22}$$

If you want temperature dependence of bulk gap, you can substitute in Eq. (16) to get

$$\ln \frac{T}{T_c} = T \sum_{\epsilon_n=-\infty}^{\infty} \left[\frac{\pi \left\langle v(\mathbf{p}, \mathbf{p}') \Delta(\mathbf{p}') / \Delta(\mathbf{p}) \sqrt{|\Delta|^2 + \epsilon_n^2} \right\rangle_{p'}}{\left\langle v(\mathbf{p}'', \mathbf{p}') \Delta(\mathbf{p}') \right\rangle_{p'} / \Delta(\mathbf{p}'') \big|_{T_c}} - \frac{\pi}{|\epsilon_n|} \right] \tag{23}$$

RICCATI PARAMETERIZATIONS

The Riccati parameterization of the Green's function is

$$\widehat{g} = -i\pi \widehat{N} \begin{pmatrix} 1 + \hat{a}\underline{\hat{a}} & 2\hat{a} \\ -2\underline{\hat{a}} & -1 - \underline{\hat{a}}\hat{a} \end{pmatrix} \tag{24}$$

where $\widehat{N}$ is

$$\widehat{N} = \begin{pmatrix} (1 - \hat{a}\underline{\hat{a}})^{-1} & 0 \\ 0 & (1 - \underline{\hat{a}}\hat{a})^{-1} \end{pmatrix} \tag{25}$$

The inverse is

$$\hat{a} = (\hat{g} - i\pi)^{-1}\hat{f} \tag{26}$$

$$\underline{\hat{a}} = (\underline{\hat{g}} + i\pi)^{-1}\underline{\hat{f}} \tag{27}$$

Substitute in the bulk Green's function to get the bulk Ricatti amplitude:

$$\hat{a} = \frac{-\hat{\Delta}}{i\epsilon_n + i\sqrt{|\Delta|^2 + \epsilon_n^2}} \tag{28}$$

$$\underline{\hat{a}} = \frac{-\hat{\Delta}^\dagger}{i\epsilon_n + i\sqrt{|\Delta|^2 + \epsilon_n^2}} \tag{29}$$

The matrix Ricatti equation is

$$i\hbar \mathbf{v}_p \cdot \boldsymbol{\nabla}\hat{a} + 2i\epsilon_n\hat{a} + \hat{a}\hat{\Delta}^\dagger\hat{a} + \hat{\Delta} = 0 \tag{30}$$

$$i\hbar \mathbf{v}_p \cdot \boldsymbol{\nabla}\underline{\hat{a}} - 2i\epsilon_n\underline{\hat{a}} - \underline{\hat{a}}\hat{\Delta}\underline{\hat{a}} - \hat{\Delta}^\dagger = 0 \tag{31}$$

^{3}HE-A

For ^{3}He-A, the spin structure is $\hat{\mathbf{d}} \cdot (i\vec{\sigma}\hat{\sigma}_y) = \hat{\sigma}_x$, and we have two components of the gap function,

$$\hat{\Delta}(\mathbf{R}, \mathbf{p}) = \hat{\sigma}_x(\Delta_1(\mathbf{R})p_x + \Delta_2(\mathbf{R})p_y) \tag{32}$$

In bulk we have $\hat{\Delta}(\mathbf{R}, \mathbf{p}) = \hat{\sigma}_x\Delta(p_x + ip_y) = \hat{\sigma}_x\Delta e^{i\phi_p}$. The interaction is $v(\mathbf{p}, \mathbf{p}') = 3v_0\hat{\mathbf{p}} \cdot \hat{\mathbf{p}}'$. Note that

$$\frac{1}{2\pi}\int_0^{2\pi} d\phi \cos\phi e^{i\phi} = \frac{1}{2} \tag{33}$$

In 2d case ($|\Delta|^2$ does not depend on $\mathbf{p}$), Eq. (18) becomes

$$\Delta(\mathbf{R}, \mathbf{p}) = \frac{2\sum_{\epsilon_n}^\infty \langle \mathbf{p} \cdot \mathbf{p}' f(\mathbf{R}, \mathbf{p}', \epsilon_n)\rangle_{p'}}{\sum_{\epsilon_n}^\infty \frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}}} \tag{34}$$

The 2d bulk gap equation is

$$\ln\frac{T}{T_c} = T\sum_{\epsilon_n = -\infty}^\infty \left[\frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}} - \frac{\pi}{|\epsilon_n|}\right] \tag{35}$$

4

S-WAVE PAIRING

For s-wave pairing, the spin structure is $i\hat{\sigma}_y$, and we have

$$\hat{\Delta}(\mathbf{R}, \mathbf{p}) = i\hat{\sigma}_y \Delta(\mathbf{R}) \tag{36}$$

In bulk we have $\hat{\Delta}(\mathbf{R}, \mathbf{p}) = i\hat{\sigma}_y \Delta$. The interaction is $v(\mathbf{p}, \mathbf{p}') = v_s$, and Eq. (18) reduces to

$$\Delta(\mathbf{R}) = \frac{\sum_n \langle f(\mathbf{R}, \mathbf{p}', \epsilon_n)\rangle_{p'}}{\sum_n \frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}}} \tag{37}$$

^{3}HE-A EDGE GAP PROFILE

We assume translational invariance along the edge, i.e. the y direction. We also assume the gap to be real(imaginary) along the $p_x(p_y)$ direction.

$$\hat{\Delta}(x, \mathbf{p}) = \hat{\sigma}_x(\Delta_1(x)p_x + i\Delta_2(x)p_y) \tag{38}$$

Here $\Delta_1(x)$ and $\Delta_2(x)$ are real functions, and we have

$$\widehat{\Delta}(x, \mathbf{p}) = \begin{pmatrix} 0 & \hat{\sigma}_x(\Delta_1(x)p_x + i\Delta_2(x)p_y) \\ -\hat{\sigma}_x(\Delta_1(x)p_x - i\Delta_2(x)p_y) & 0 \end{pmatrix} \tag{39}$$

$$= i\hat{\sigma}_x(\Delta_2 p_y \widehat{\tau}_1 + \Delta_1 p_x \widehat{\tau}_2) \tag{40}$$

We can also write the anomalous Green's function as corresponding components to $\Delta_{1,2}$

$$\hat{f}(\mathbf{R}, \mathbf{p}, \epsilon_n) = \hat{\sigma}_x\left(f_1(\mathbf{R}, \mathbf{p}, \epsilon_n) + if_2(\mathbf{R}, \mathbf{p}, \epsilon_n)\right) \tag{41}$$

$$\underline{\hat{f}}(\mathbf{R}, \mathbf{p}, \epsilon_n) = -\hat{\sigma}_x\left(f_1(\mathbf{R}, \mathbf{p}, \epsilon_n) - if_2(\mathbf{R}, \mathbf{p}, \epsilon_n)\right) \tag{42}$$

where $f_{1,2}$ are complex functions, and we have

$$\widehat{g} = \hat{g}\widehat{\tau}_3 + i\hat{\sigma}_x(f_2\widehat{\tau}_1 + f_1\widehat{\tau}_2) \tag{43}$$

where

$$f_1 = \frac{f - \underline{f}}{2} \quad \text{and} \quad f_2 = \frac{f + \underline{f}}{2i} \tag{44}$$

In this case, we can even write the gap equation as

$$\Delta_{1,2}(x) = T \sum_{\epsilon_n = -\omega_c}^{\omega_c} \langle v(\mathbf{p}_{x,y}, \mathbf{p}')f_{1,2}(x, \mathbf{p}', \epsilon_n)\rangle_{p'} \tag{45}$$

5

and the gap iteration becomes

$$\Delta_{1,2}(x) = \frac{2\sum_n \langle \mathbf{p}_{x,y} \cdot \mathbf{p}' f_{1,2}(x, \mathbf{p}', n) \rangle_{p'}}{\sum_n \frac{\pi}{\sqrt{|\Delta|^2 + \epsilon_n^2}}} \tag{46}$$

We only need to sum over the positive Matsubara frequencies and take real part because if we substitute Eq. (41,42) into Eq. (14), we get

$$f_1(\epsilon_n) - if_2(\epsilon_n) = f_1^*(-\epsilon_n) - if_2^*(-\epsilon_n) \tag{47}$$

Since $f_{1,2}$ are seperate components in the (particle-hole $\otimes$ spin) space, we have

$$f_{1,2}(\epsilon_n) = f_{1,2}^*(-\epsilon_n) \tag{48}$$

Similarly we also have

$$-f_{1,2}(-\mathbf{p}, \mathbf{R}, \epsilon_n) = f_{1,2}(\mathbf{p}, \mathbf{R}, -\epsilon_n) \tag{49}$$

and we also only need to average the angular part over a half circle, because

$$\int_0^{2\pi} \frac{d\theta_{p'}}{2\pi} \mathbf{p}_{x,y} \cdot \mathbf{p}' f_{1,2}(\mathbf{p}', \mathbf{R}, \epsilon_n) \tag{50}$$

$$= \left(\int_{-\pi/2}^{\pi/2} + \int_{\pi/2}^{3\pi/2} \right) \frac{d\theta_{p'}}{2\pi} \mathbf{p}_{x,y} \cdot \mathbf{p}' f_{1,2}(\mathbf{p}', \mathbf{R}, \epsilon_n) \tag{51}$$

$$= \int_{-\pi/2}^{\pi/2} \frac{d\theta_{p'}}{2\pi} \mathbf{p}_{x,y} \cdot \mathbf{p}' \left[f_{1,2}(\mathbf{p}', \mathbf{R}, \epsilon_n) - f_{1,2}(-\mathbf{p}', \mathbf{R}, \epsilon_n) \right] \tag{52}$$

$$= \int_{-\pi/2}^{\pi/2} \frac{d\theta_{p'}}{2\pi} \mathbf{p}_{x,y} \cdot \mathbf{p}' \left[f_{1,2}(\mathbf{p}', \mathbf{R}, \epsilon_n) + f_{1,2}(\mathbf{p}', \mathbf{R}, -\epsilon_n) \right] \tag{53}$$

$$= \int_{-\pi/2}^{\pi/2} \frac{d\theta_{p'}}{2\pi} \mathbf{p}_{x,y} \cdot \mathbf{p}' \left[f_{1,2}(\mathbf{p}', \mathbf{R}, \epsilon_n) + f_{1,2}^*(\mathbf{p}', \mathbf{R}, \epsilon_n) \right] \tag{54}$$

$$= \int_{-\pi/2}^{\pi/2} \frac{d\theta_{p'}}{\pi} \mathbf{p}_{x,y} \cdot \mathbf{p}' \operatorname{Re}\{ f_{1,2}(\mathbf{p}', \mathbf{R}, \epsilon_n) \} \tag{55}$$

Numerical solution

The bulk gap temperature dependence is

$$\ln t = \pi t \sum_{n=-\infty}^{\infty} \left[\frac{1}{\sqrt{\delta(t)^2 + e_n^2}} - \frac{1}{|e_n|} \right] \tag{56}$$

6

The dimensionless iteration of the gap function is

$$\delta_{1,2}(x) = \frac{2\sum_{n\geq 0}\langle \mathbf{p}_{x,y}\cdot\mathbf{p}'\,\mathrm{Re}\{f_{1,2}(x,\mathbf{p}',n)\}\rangle_{p'}}{\sum_{n\geq 0}\frac{\pi}{\sqrt{1+e_n^2/\delta(t)^2}}} \tag{57}$$

where $t = T/T_c$, $\delta_{1,2}(x) = \Delta_{1,2}(x)/|\Delta(T)|$, $e_n = \epsilon_n/T_c$ and $\delta(t) = |\Delta(T)|/T_c$. The Ricatti equation is

$$ip_x\partial_x a(\mathbf{p},x) + \frac{ie_n}{\delta(t)}a(\mathbf{p},x) + \frac{\delta^*(\mathbf{p},x)}{2}a^2(\mathbf{p},x) + \frac{\delta(\mathbf{p},x)}{2} = 0 \tag{58}$$

$$ip_x\partial_x \underline{a}(\mathbf{p},x) - \frac{ie_n}{\delta(t)}\underline{a}(\mathbf{p},x) - \frac{\delta(\mathbf{p},x)}{2}\underline{a}^2(\mathbf{p},x) - \frac{\delta^*(\mathbf{p},x)}{2} = 0 \tag{59}$$

where $\xi = \hbar v_f/2|\Delta(T)|$, and $\partial_x = \xi\nabla_x$. The p_x can be interpreted as the projection of quasiparticle trajectory along the x direction. We can get g and $f_{1,2}$ from Eq. (44) and Eq. (24),

$$g = -i\pi\frac{1+a\underline{a}}{1-a\underline{a}} \tag{60}$$

$$f_1 = -i\pi\frac{a+\underline{a}}{1-a\underline{a}} \tag{61}$$

$$f_2 = -\pi\frac{a-\underline{a}}{1-a\underline{a}} \tag{62}$$

We first assume an initial guess for the gap function $\delta(\mathbf{r},\hat{\mathbf{p}})$. For each trajectory $\hat{\mathbf{p}}$ along which the quasiparticle propagates, we can solve the Eilenberger equation to get the Green's function $g(\mathbf{r},\hat{\mathbf{p}},n)$ and the anomalous Green's function $f(\mathbf{r},\hat{\mathbf{p}},n)$. Then we iterate to update the gap function $\delta(\mathbf{r},\hat{\mathbf{p}})$ by solving the gap equation. Repeat until convergence.

4-TH ORDER RUNGE-KUTTA METHOD

We can use the 4-th order Runge-Kutta method to solve the Riccati equation.

$$\partial_x a(\mathbf{p},x) = \frac{i}{p_x}\left(\frac{ie_n}{\delta(t)}a(\mathbf{p},x) + \frac{\delta_1(x)p_x - i\delta_2(x)p_y}{2}a^2(\mathbf{p},x) + \frac{\delta_1(x)p_x + i\delta_2(x)p_y}{2}\right) \tag{63}$$

$$\partial_x \underline{a}(\mathbf{p},x) = \frac{-i}{p_x}\left(\frac{ie_n}{\delta(t)}\underline{a}(\mathbf{p},x) + \frac{\delta_1(x)p_x + i\delta_2(x)p_y}{2}\underline{a}^2(\mathbf{p},x) + \frac{\delta_1(x)p_x - i\delta_2(x)p_y}{2}\right) \tag{64}$$

For an ODE

$$\frac{\mathrm{d}a}{\mathrm{d}x} = f(x,a) \tag{65}$$

7

when step size is h, RK4 method gives

$$k_1 = f(x_n, a_n) \tag{66}$$

$$k_2 = f\left(x_n + \frac{h}{2}, a_n + \frac{h}{2}k_1\right) \tag{67}$$

$$k_3 = f\left(x_n + \frac{h}{2}, a_n + \frac{h}{2}k_2\right) \tag{68}$$

$$k_4 = f(x_n + h, a_n + hk_3) \tag{69}$$

$$a_{n+1} = a_n + \frac{h}{6}(k_1 + 2k_2 + 2k_3 + k_4) \tag{70}$$

When iteratively solving the Ricatti equation and the gap equation, we can interpolate the gap function to get the half step value $\delta_{1,2}(x_n + h/2)$.

CURRENT DENSITY

Reference Kita's book, section 14.3.3. The one-particle density matrix is

$$\rho_{\uparrow\uparrow}(\mathbf{r}, \mathbf{r}') \equiv \left\langle \psi_\uparrow^\dagger(\mathbf{r}')\psi_\uparrow(\mathbf{r}) \right\rangle = G_{\uparrow\uparrow}(\mathbf{r}, \mathbf{r}'; 0^-) = T\sum_{n=-\infty}^{\infty} G_{\uparrow\uparrow}(\mathbf{r}, \mathbf{r}'; i\epsilon_n)e^{-i\epsilon_n 0^-} \tag{71}$$

The local current density is

$$\mathbf{j}(\mathbf{R}) = T\sum_n \frac{1}{V}\sum_p \frac{\mathbf{p}}{m^*} \text{Tr}\left\{\hat{G}(\mathbf{R}, \mathbf{p}; i\epsilon_n)\right\} \tag{72}$$

In 2d case, we have

$$\frac{1}{V}\sum_p = \int \frac{\mathrm{d}^2 p}{(2\pi\hbar)^2} = \iint \frac{p\mathrm{d}\theta_p \mathrm{d}p}{(2\pi\hbar)^2} = \int N_f \mathrm{d}\xi_p \int \frac{\mathrm{d}\theta_p}{2\pi} \quad \text{where} \quad N_f = \frac{m^*}{2\pi\hbar^2} \tag{73}$$

The particle density is derived by dividing the total phase space volume πk_f^2 by the volume of the unit cell $(2\pi/L)^2$, times 2 for spin.

$$N = 2 \times \frac{\pi p_f^2/\hbar^2}{(2\pi/L)^2} = \frac{p_f^2}{2\pi\hbar^2}V \rightarrow n = \frac{N}{V} = \frac{p_f^2}{2\pi\hbar^2} = N_f p_f v_f \tag{74}$$

In 3d case, we have

$$\frac{1}{V}\sum_p = \int \frac{\mathrm{d}^3 p}{(2\pi\hbar)^3} = \int \frac{m^* p\mathrm{d}\xi_p}{2\pi^2\hbar^3}\frac{\mathrm{d}\Omega_p}{4\pi} \approx \int N_f \mathrm{d}\xi_p \int \frac{\mathrm{d}\Omega_p}{4\pi} \quad \text{where} \quad N_f = \frac{m^* p_f}{2\pi^2\hbar^3} \tag{75}$$

8

and

$$N = 2 \times \frac{\frac{4}{3}\pi p_f^3/\hbar^3}{(2\pi/L)^3} = \frac{p_f^3}{3\pi^2\hbar^3}V \rightarrow n = \frac{N}{V} = \frac{2}{3}N_f p_f v_f \tag{76}$$

Do the ξ_p integration, we get

$$\mathbf{j}(\mathbf{R}) = 2N_f T \sum_n \langle \mathbf{v}_p g(\mathbf{R}, \mathbf{p}, \epsilon_n) \rangle_p \tag{77}$$

Multiple it by the quasiparticle mass $p_f = m^* v_f$, and we get the mass current density:

$$\mathbf{j}_m(\mathbf{R}) \equiv m^* \mathbf{j}(\mathbf{R}) = \frac{N_f v_f p_f}{4}\hbar \times \frac{4T}{\xi(T)|\Delta(T)|} \sum_n \langle \hat{\mathbf{p}} g(\mathbf{R}, \mathbf{p}, \epsilon_n) \rangle_p \tag{78}$$

where $\xi(T) = \hbar v_f/2|\Delta(T)|$ is the coherence length, and $n = N_f p_f v_f$ is the particle density. The ground state angular momentum in a cylinder is

$$\mathbf{L} = \int_0^R \mathrm{d}^2 r\, \mathbf{r} \times \mathbf{j}_m(\mathbf{r}) \tag{79}$$

$$= 2\pi\hat{\mathbf{z}} \int_0^R \mathrm{d}r\, r^2 j_m(r) \tag{80}$$

$$\approx 2\pi R^2 \hat{\mathbf{z}} \int_{R-\xi}^R \mathrm{d}r\, j_m(r) \tag{81}$$

$$\approx 2V\hat{\mathbf{z}} \int_0^R \mathrm{d}r\, j_m(r) \tag{82}$$

$$= \frac{N}{2}\hbar\hat{\mathbf{z}} \times \frac{4T}{\xi(T)|\Delta(T)|} \int_0^R \mathrm{d}r \sum_n \langle p_y g(\mathbf{r}, \mathbf{p}, \epsilon_n) \rangle_p \tag{83}$$

CONSTANT GAP

For constant gap, reference Sauls 2011, we have

$$g(x, \mathbf{p}, \epsilon_n) = -\frac{\pi i \epsilon_n}{\lambda} - \frac{\pi \Delta_1}{\lambda} \frac{i\epsilon_n \Delta_1 + \lambda \Delta_2}{\Delta_2^2 + \epsilon_n^2} e^{-\frac{\lambda}{\Delta_1}\frac{x}{\xi}} \tag{84}$$

where here we denote $\Delta_{1,2} \equiv \Delta p_{x,y}$, and $\lambda = \sqrt{\Delta^2 + \epsilon_n^2}$. The $i\epsilon_n$ term doesn't contribute to the angular momentum, as its Matsubara sum gives zero. After we integrate over the radial coordinate, we get

$$L = \frac{N}{2}\hbar \times \frac{4T}{\Delta} \sum_n \left\langle p_y \pi \frac{\Delta_1^2}{\lambda} \frac{\Delta_2}{\Delta_2^2 + \epsilon_n^2} \right\rangle_p \tag{85}$$

According to ChatGPT and Gemini, the angle integral gives

$$\int_0^{2\pi} \mathrm{d}\theta_p \frac{p_x^2 p_y^2}{p_y^2 + a^2} = \pi \left(\sqrt{a^2 + 1} - |a| \right)^2 \tag{86}$$

and we have

$$L = \frac{N}{2}\hbar \times 4\pi^2 T \sum_n \frac{(\lambda - |\epsilon_n|)^2}{\Delta^2 \lambda} \tag{87}$$

According to ChatGPT and Gemini, the Matsubara sum gives

$$L = \frac{N}{2}\hbar \times 2\pi \tag{88}$$

we are clearly missing a factor of 2π here.

ANALYTIC CONTINUATION

For the integration contour C being an infinite circle, assume function $g(z)$ has no poles inside the contour and vanishes at infinity, the residue theorem gives

$$\oint_C dz n_F(z)g(z) = 2\pi i \sum_{\text{poles}} \text{Res}\{n_F(z)g(z)\} = 2\pi i \, (-T) \sum_{n=-\infty}^{\infty} g(\epsilon_n) \tag{89}$$

The residue of the Fermi distribution function $\text{Res}\{n_F(z)\} = -T$. We can seperate the contour into upper and lower half circles, which gives

$$\oint_C dz n_F(z)g(z) = \left(\oint_{\text{upper}} + \oint_{\text{lower}} \right) dz n_F(z)g(z) \tag{90}$$

$$= \int_{-\infty}^{\infty} d\epsilon n_F(\epsilon)g^R(\epsilon + i0^+) + \int_{\infty}^{-\infty} d\epsilon n_F(\epsilon)g^A(\epsilon - i0^+) \tag{91}$$

$$= \int_{-\infty}^{\infty} d\epsilon n_F(\epsilon) \left[g^R(\epsilon + i0^+) - g^A(\epsilon - i0^+) \right] \tag{92}$$

$$= \int_{-\infty}^{\infty} d\epsilon n_F(\epsilon) 2i \, \text{Im}\{g^R(\epsilon + i0^+)\} \tag{93}$$

and we get

$$T \sum_{n=-\infty}^{\infty} g(\epsilon_n) = \int_{-\infty}^{\infty} d\epsilon n_F(\epsilon) \left(-\frac{1}{\pi} \text{Im}\{g^R(\epsilon + i0^+)\} \right) \tag{94}$$

Analytically continue Eq. (77) to real frequency, we get

$$\mathbf{j}(\mathbf{R}) = 2N_f \int d\epsilon n_F(\epsilon) \left\langle \mathbf{v}_p \left(-\frac{1}{\pi} \text{Im}\{g(\mathbf{R}, \mathbf{p}, \epsilon)\} \right) \right\rangle_p \tag{95}$$
